1 Notes for the Reader

This operating manual contains information and behaviour rules for the safe and designated operation of the product.

Observe the following principles:

- Read the entire operating manual prior to starting-up the device.
- Ensure that everyone who works with or on the product has read the operating manual and follows the instructions.
- Maintain the operating manual throughout the service life of the product.
- Pass the operating manual on to any subsequent owner of the product.

1.1 General non-discrimination

In this operating manual, only the male gender is used where grammar allows gender allocation. The purpose of this is to make the text easy to read. Men and women are always referred to equally. We would like to ask female readers for understanding of this text simplification.

1.2 Explanation of the signal words

Different signal words in combination with warning signs are used in this operating manual. Signal words illustrate the gravity of possible injuries if the risk is ignored:

<table>
<thead>
<tr>
<th>Signal word</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DANGER</td>
<td>Refers to imminent danger. Ignoring this sign may lead to death or the most serious injuries.</td>
</tr>
<tr>
<td>WARNING</td>
<td>Refers to a potentially hazardous situation. Failure to follow this instruction may lead to death or severe injuries.</td>
</tr>
<tr>
<td>CAUTION</td>
<td>Refers to a potentially hazardous situation. Failure to follow this instruction may lead to minor injury or damage to property.</td>
</tr>
<tr>
<td>PLEASE NOTE</td>
<td>Refers to a danger which, if ignored, may lead to risk to the machine and its function.</td>
</tr>
</tbody>
</table>

Tab. 1: Explanation of the signal words

1.3 Explanation of the warning signs

Warning signs represent the type and source of a danger:

<table>
<thead>
<tr>
<th>Warning sign</th>
<th>Type of danger</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Danger point</td>
</tr>
<tr>
<td></td>
<td>Danger from potentially-explosive substances</td>
</tr>
<tr>
<td></td>
<td>Danger from corrosive substances</td>
</tr>
<tr>
<td></td>
<td>Danger of damage to machine or functional influences</td>
</tr>
</tbody>
</table>

Tab. 2: Explanation of the warning signs

1.4 Identification of warnings

Warnings are intended to help you recognise risks and avoid negative consequences.

This is how warnings are identified:

<table>
<thead>
<tr>
<th>Warning sign</th>
<th>SIGNAL WORD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description of danger.</td>
<td></td>
</tr>
<tr>
<td>Consequences if ignored.</td>
<td></td>
</tr>
<tr>
<td>➞ The arrow signals a safety precaution to be taken to eliminate the danger.</td>
<td></td>
</tr>
</tbody>
</table>

1.5 Instruction for action identification

This is how pre-conditions for action are identified:

✔ Pre-condition for action which must be met before taking action.

☒ A resource such as a tool or auxiliary materials required to perform the operating instructions.

This is how instructions for action are identified:

➢ Separate step with no follow-up action.
   1. First step in a series of steps.
   2. Second step in a series of steps.
   ➢ Result of the above action.
   ✔ Action completed, aim achieved.
2 Safety

2.1 General warnings

The following warnings are intended to help you to eliminate the dangers that can arise while handling the product. Risk prevention measures always apply regardless of any specific action.

Safety instructions warning against risks arising from specific activities or situations can be found in the respective sub-chapters.

**DANGER**

Danger to life through explosions!
The use of devices and fittings without ATEX certification in a potentially explosive atmosphere can result in potentially-fatal explosions.

⇒ Never use devices and fittings without ATEX certification in a potentially-explosive atmosphere.

**WARNING**

Caustic burns or other burns through dosing media!
While working on the dosing head, valves and connections, you may come into contact with dosing media.

⇒ Use sufficient personal protective equipment.
⇒ Rinse the dosing pump with a liquid (e.g. water) which does not pose any risk. Ensure that the liquid is compatible with the dosing medium.
⇒ Release pressure in hydraulic parts.
⇒ Never look into open ends of plugged pipelines and valves.

**CAUTION**

Danger when changing the dosing medium!
Changing the dosing media can provoke unexpected reactions, damage to property and injury.

⇒ Clean the product and the system parts in contact with the media thoroughly before changing the dosing medium.
⇒ Make sure that the lubricants, adhesives, sealants, etc. that you use are also suitable for the new dosing medium.

**PLEASE NOTE**

Damage from incorrect use as a back-pressure valve
Stainless steel (1.4571) spring-loaded seat valves may not be used as a back-pressure valve. Its use as a back-pressure valve increases wear and shortens the lifetime of the valve.

⇒ Use the stainless steel (1.4571) spring-loaded seat valve as a pressure-relief valve only.
2.2 Hazards due to non-compliance with the safety instructions

Failure to follow the safety instructions may endanger not only persons, but also the environment and the device.

The specific consequences can be:
- Failure of major functions of the product
- Failure of required maintenance and repair methods
- Danger for individuals through dangerous dosing media
- Danger to the environment caused by substances leaking from the system

2.3 Working in a safety-conscious manner

Besides the safety instructions specified in this operating manual, further safety rules apply and must be followed:
- Accident prevention regulations
- Safety and operating provisions
- Safety provisions for handling dangerous substances (mostly the safety data sheets to dosing media)
- Environmental protection provisions
- Applicable standards and legislation

2.4 Personal protective equipment

Based on the degree of risk posed by the dosing medium and the type of work you are carrying out, you must use corresponding protective equipment. Read the Accident Prevention Regulations and the Safety Data Sheets to the dosing media find out what protective equipment you need.

You will require the minimum of the following personal protective equipment:

<table>
<thead>
<tr>
<th>Personal protective equipment required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protective goggles</td>
</tr>
<tr>
<td>Protective clothing</td>
</tr>
<tr>
<td>Protective gloves</td>
</tr>
</tbody>
</table>

Tab. 3: Personal protective equipment required

Wear the following personal protective equipment when performing the following tasks:
- Commissioning
- Working on the product during operation
- Shut-down
- Maintenance work
- Disposal

2.5 Personnel qualification

Any personnel who work on the product must have appropriate special knowledge and skills.

Anybody who works on the product must meet the conditions below:
- Attendance at all the training courses offered by the owner
- Personal suitability for the respective activity
- Sufficient qualification for the respective activity
- Training into the handling of the device
- Knowledge of safety equipment and the way this equipment functions
- Knowledge of this operating manual, particularly of safety instructions and sections relevant for the activity
- Knowledge of fundamental regulations regarding health and safety and accident prevention

All persons must generally have the following minimum qualification:
- Training as specialists to carry out work on the product unsupervised
- Sufficient training that they can work on the product under the supervision and guidance of a trained specialist

These operating instructions differentiate between these user groups:

2.5.1 Specialist staff

Thanks to their professional training, knowledge, experience and knowledge of the relevant specifications, specialist staff are able to perform the job allocated to them and recognise and/or eliminate any possible dangers by themselves.

2.5.2 Trained persons

Trained persons have received training from the operator about the tasks they are to perform and about the dangers stemming from improper behaviour.

In the table below you can check what qualifications are the pre-condition for the respective tasks. Only people with appropriate qualifications are allowed to perform these tasks!

<table>
<thead>
<tr>
<th>Qualification</th>

</tbody>
</table>

Tab. 4: Personnel qualification
3 Intended use

3.1 Notes on product warranty

Any non-designated use of the product can compromise its function or intended protection. This leads to invalidation of any warranty claims!

Please note that liability is on the side of the user in the following cases:

- The product is operated in a manner which is not consistent with this operating manual, particularly the safety instructions, handling instructions and the section "Intended use".
- No original spare parts or accessories are used.
- The user uses different dosing media than those indicated in the order.
- The user uses different dosing media than those indicated in the order.
- The user does not use dosing media under the conditions agreed with the manufacturer such as modified concentration, density, temperature, contamination, etc.

3.2 Intended purpose

Back-pressure and pressure-relief valves are fittings for dosing systems. Depending on the task involved, they are used to increase the dosing accuracy or to protect the system against excess pressure.

3.2.1 Use as a back-pressure valve

With the dosing of fluids, back-pressure valves generate a defined back pressure on the pressure side of a dosing pump.

This is required in the following cases:

- Strongly fluctuating pressure. Exact dosing results are impossible without a back-pressure valve.
- The pressure on the suction side is higher than on the pressure side.
- Dosing in a pressureless line is required.

3.2.2 Use as a pressure-relief valve

Pressure relief valves have an important safety function for protecting the dosing pump and the associated pipes and fittings. The dosing pump can generate a pressure that is many times the rated one.

Various reasons, e.g. soiling or operating errors can result in blocked pressure lines. At an appropriate pressure, a pressure relief valve opens a bypass line and protects the system in this way from damage caused by over-pressure.

3.3 Explosive risk zone

The type DN6, 200 bar and DN10, 250 bar spring-loaded seat valves can be deployed in potentially-explosive atmospheres. They may only be used as pressure-relief valves.

All other back-pressure and pressure-relief valves may not be used in a potentially explosive atmosphere.

3.4 Principles

- Back-pressure and pressure-relief valves may not be used as non-return valves.
- Back-pressure and pressure-relief valves may not be used as shutoff valves.
- Comply with the information regarding the operating and environmental conditions (see 4 “Technical data” on page 8).
- Any restrictions regarding the viscosity, temperature and density of dosing media must be followed. You must only use dosing media at temperatures above freezing point or below the boiling point of the respective medium.
- The specified flow capacity (see 4 “Technical data” on page 8) applies to uniform flows of water and other liquids, which are comparable to water in terms of viscosity and density, given dosing with a sufficiently-apportioned pulsation damper. An uneven flow without a pulsation damper can result in a far lower flow capacity.
- The materials of the product and hydraulic parts of the system must be suitable for the dosing medium used. In this connection, note that the resistance of these components can change in dependence on the temperature of the media and the operating pressure.

Information on the suitability of materials combined with different dosing media can be found in the Compatibility Chart of the manufacturer.

The information in this resistance list is based on information from the material manufacturers and on expertise obtained from handling the materials.

As the durability of the materials depends on many factors, this list only constitutes initial guidance on selecting material. In all cases, test the equipment with the chemicals you use under operating conditions.

6 Installation

6.1 Principles
When installing, follow the basic principles below:
- Work in accordance with the flow direction of the back-pressure and pressure-relief valve (see Fig. 7).
- Always fit the spring-loaded seat valve vertically. All other back-pressure and pressure-relief valves can be fitted in any installation position.
- A pressure gauge must be fitted in front of the valve in order to adjust the pre-tension pressure of the back-pressure and pressure-relief valves to the operating conditions of the dosing system.

6.2 Installation with a back-pressure valve and pressure-relief valve
In the following installation example, a back-pressure valve (3) and a pressure-relief valve (4) are inserted. The return of the dosing medium leads into the suction line. In this case, there must not be a non-return valve or a foot valve in the suction line. You should install the pressure-relief valve as close as possible to the dosing head.

6.3 Installation with pressure relief valve – returning to the tank
Installation of a pressure-relief valve with return to the tank possible The pressure in the dosing tank must not be too high so that it is possible to accommodate the returned dosing medium.
6.4 Connecting hose clamp connection

Choose the hose connection according to the condition of the hose (material, inner diameter, wall thickness) in order to ensure maximum pressure resistance.

6.4.1 Size 4/6 and 6/9

![Diagram of hose connections 4/6 and 6/9](image)

Perform the following working steps:
1. Cut the hose (1) to the appropriate length neatly and at an exact right angle.
2. Place a gasket that is suitable for the dosing medium between the connection (5) and the valve.
3. Screw the connecting piece to the back-pressure and pressure relief valve using the union nut (2).
4. Thread the union nut (3) and the clamping ring (4) onto the hose.
5. Plug the hose all the way into the grommet of connection piece.
6. Push the clamping ring onto the grommet of connection piece and screw it to the union nut.

✔ Hose clamp connection connected.

6.4.2 Size 6/12

![Diagram of hose connections 6/12](image)

Size 6/12 hose clips only have a union nut. It clamps the hose onto the grommet of the connection piece and at the same time fastens.

Perform the following working steps:
1. Cut the PVC tube to length.
2. Push the union nut (1) onto the tube.
3. Glue the bonding sleeve (2) to the pipe (observe the manufacturer’s instructions for the adhesive).
4. Screw the the union nut to the connection of the back-pressure and pressure relief valve. Use a gasket that is suitable for the dosing medium.

✔ Cemented connection connected.

6.5 Connecting cemented connection

![Diagram of cemented connection](image)

Perform the following working steps:
1. Cut the PVC tube to length.
2. Push the union nut (1) onto the tube.
3. Glue the bonding sleeve (2) to the pipe (observe the manufacturer’s instructions for the adhesive).
4. Screw the the union nut to the connection of the back-pressure and pressure relief valve. Use a gasket that is suitable for the dosing medium.

✔ Cemented connection connected.

6.6 Connecting threaded connection

![Diagram of threaded connection](image)

Perform the following working steps:
1. Cut the tube to length.
2. Cut the thread (2) onto the end of the tube.
3. Push the union nut (1) onto the tube.
4. Seal the thread. When choosing your sealing material, take into account its resistance to material, temperature and pressure.
5. Screw the the union nut to the connection of the back-pressure and pressure relief valve. Use a gasket that is suitable for the dosing medium.

✔ Threaded connection connected.
7 Operation

Setting the pre-tension pressure

Precondition for action:

✓ The entire system has been installed hydraulically and (if required) electrically.

✓ All the mechanical fastenings have been inspected to ensure adequate load-bearing capacity.

✓ All the hydraulic sections have been inspected to ensure they are adequately leak-proof and that the through flow direction is correct.

✓ The system is fitted with a pressure gauge to read off the operating pressure.

✓ Personnel have read all the operating instructions and understood them completely.

During initial start-up, use water as the dosing medium so as to check the leak-tightness of the system. Check first whether undesirable reactions could occur between the actual dosing medium and the water.

Perform the following working steps:

1. Loosen the counternut on the back-pressure and pressure-relief valve.
2. Turn the pressure setting screw anti-clockwise until it moves freely.
3. Open all the shutoff valves.
4. Startup the dosing pump. Increase the delivery capacity slowly to the required level.
5. Turn the pressure setting screw clockwise slowly.
   - The operating pressure increases.

When using as a back-pressure valve:

6. Once the desired operating pressure has been reached, screw the counternut clockwise until the pressure setting screw is no longer easy to loosen.
7. Check whether the operating pressure set remains constant over a long period.

When using as a pressure-relief valve:

6. Increase the inlet pressure tension until the pressure-relief valve does not open any further.
7. Turn the pressure setting screw c. half a revolution further to avoid any excess flow resulting from fluctuating operating pressures.

✓ Pre-tension pressure set.
8 Maintenance

Back-pressure and pressure relief valves are produced to the highest quality standards, and have a long service life. Nevertheless, some of their parts are subject to wear due to operation (e.g. diaphragms, valve seats, valve balls). This means that regular visual inspections are necessary to ensure a long operating life. Regular maintenance will protect the device from operation interruptions.

PLEASE NOTE

Function of the valve compromised

Tightening the union nut by hand means that the sufficient leak-tightness of the diaphragm has not been ensured. High pressures cannot be maintained in this fashion.

⇒ Use a suitable tool to tighten the union nut. Do not use any tools which could damage the components (e.g. a water pump wrench). Should you not have a suitable tool, the valve must be pre-tensioned lengthwise e.g. in a vice. The union nut can then be tightened by hand.

8.1 Valves DN6 – DN15 (spring-loaded diaphragm valve)

Perform the following working steps:

1. Loosen the counter nut (3) until the pressure setting screw (2) moves freely.
2. Unscrew the pressure setting screw (2) from the valve cap (4).
3. Loosen the union nut (1).
4. Remove the valve cap.
5. Remove the diaphragm (8), spring plate (7), compression spring (6) and washer (5). Back-pressure and pressure relief valves with diaphragms made of FPM (Viton) and EPDM contain one diaphragm. Back-pressure and pressure relief valves DN6 with diaphragms made of EPDM-PTFE contain two diaphragms (10 and 11. Fig. 15).

6. Clean the valve body (9).
7. Insert a new diaphragm (8 or 11) in the valve body with the coated side facing downwards. Should your back-pressure and pressure-relief valve be fitted with two diaphragms, insert an uncoated diaphragm (10) over it.
8. Insert the washer, compression spring and spring plate in the valve cap.
9. Insert the valve cap in the valve body.
10. Screw the union nut onto the valve body.
11. Screw the pressure setting screw in the valve cap with the counter nut.
12. Set the specific pre-tension pressure.

✔ Diaphragm has been replaced.
8.2 Valves DN25 – DN65 (spring-loaded diaphragm valve)

Perform the following working steps:

1. Loosen the counternut (2) until the pressure setting screw (1) moves freely.
2. Unscrew the pressure setting screw from the valve cap (6).
3. Remove the four protective caps (3).
4. Loosen the four hexagon nuts (4).
5. Remove the four washers (5).
6. Remove the valve cap.
7. Remove the diaphragm (10), diaphragm disc (9), compression spring (8) and spring plate (7).
8. Clean the valve body (11).
9. Insert a new diaphragm in the valve body with the coated side facing downwards.
10. Insert the spring plate, compression spring and diaphragm disc in the valve cap.
11. Place the valve cap on the valve body.
12. Insert the four washers.
13. Screw the four hexagon nuts tight. Tighten the hexagonal nuts equally in a criss-cross sequence. Recommended torque: 8 Nm
14. Place the four protective caps on the hexagon nuts
15. Screw the pressure setting screw in the valve cap with the counternut.
16. Set the specific pre-tension pressure.

Diaphragm has been replaced.

9 Transport, storage and disposal

The back-pressure and pressure relief valves are delivered in cardboard packaging and should always be transported in it:

- The packaging material is re-usable.
- The back-pressure and pressure relief valves are to be completely emptied and cleaned before storage.
- The ambient conditions are to be observed.

10 Spare parts

The following spare parts are available for the back-pressure and pressure-relief valves in various designs:

- Diaphragms
- Seals
- Seats for pressure-relief valve DN6

You can find the corresponding article numbers in our price list.
11 Declaration of no objection

Declaration of no objection

Please fill out a separate form for each appliance!

We forward the following device for repairs:

Device and device type: ......................................................... Part-no.: ..............................................................
Order No.: ........................................................................ Date of delivery: .......................................................

Reason for repair: ........................................................................................................................................
......................................................................................................................................................................
......................................................................................................................................................................

Dosing medium

Description: ................................................................. Irritating: □ Yes □ No
Properties: ................................................................. Corrosive: □ Yes □ No

We hereby certify, that the product has been cleaned thoroughly inside and outside before returning, that it is free from hazardous material (i.e. chemical, biological, toxic, flammable, and radioactive material) and that the lubricant has been drained.

If the manufacturer finds it necessary to carry out further cleaning work, we accept the charge will be made to us.

We assure that the aforementioned information is correct and complete and that the unit is dispatched according to the legal requirements.
